

AuraSight Surgical

Real-Time Spatial Mapping for Surgical Reconstruction.

Static Map For Dynamic World

The Paradigm

Preoperative scans provide a high-resolution map of the patient's anatomy.

The Blind Spot

These scans represent a singular snapshot in time. They do not account for what happens once surgery begins.

The Assumption

Surgeons enter the OR assuming the safety margins mapped in the scan will remain perfectly static throughout the procedure.

The Reconstructive Reality: The map is no longer the territory

Tissue Shift

Once an incision is made and tissue is retracted, the anatomy physically shifts. Spatial coordinates of critical structures are permanently altered.

The Navigation Failure

A nerve bundle that appeared safe on the pre-op MRI is now directly in the surgical path.

The Human Limit

Surgeons are forced to rely entirely on human depth perception to navigate these altered microscopic safety margins.

The Consequence

A millimetre of error results in iatrogenic injury-accidental trauma to hidden nerves or major vascular networks.

The Mechanical Problem of Surgical Navigation

	Preoperative Scan	Intraoperative Reality
Tissue State	Static and uncompromised	Dynamic, manipulated, and retracted
Safety Margins	Assumed safe based on initial (X, Y, Z) imaging	Shifting coordinates obscuring hidden dangers
Surgeon Reliance	Objective, machine-generated imaging	Subjective human depth perception

Relying on static imaging for dynamic surgery is a mechanical failure requiring an engineering solution.

Sub-Millimeter Spatial Mapping with Zero Hardware Overhead

The AuraSight Platform

A Software as a Service (SaaS) platform built to eliminate iatrogenic injury.

Hardware Agnostic Transformation

Marker less computer vision turns standard OR cameras or AR headsets into real-time spatial sensors.

The Output

Real-time spatial coordinate mapping of surgical instruments projected directly into the surgeon's field of view..

AuraSight Surgical :Calculating Collision Before Contact

Turning Standard OR Hardware into Spatial sensors

Scalable SaaS Architecture Without Capital Intensive Robotics

The Business Core: *B2B SaaS Licensing*

Annual software subscriptions for hospital networks without requiring the purchase of million dollar proprietary robotic hardware.
